What is a FibroScan examination?

FibroScan is a quick, painless, and completely non-invasive exam of your liver. It works by emitting a small pulse of energy via a probe on your skin in order to measure the stiffness of your liver. You will lie on your back with your right arm raised behind your head. Your healthcare provider will apply a water-based gel to your skin and then place the probe on the right side of your ribcage to obtain a minimum of 10 quick measurements. You may feel a slight vibration on the skin at the tip of the probe during the exam. FibroScan is safe for patients who are pregnant or who have implantable devices.

How to prepare for your FibroScan exam.

- No alcohol 3 days prior to testing
- Do not eat or drink anything for at least 4 hours prior to your examination. This includes no mints, no chewing gum, and no black coffee.
- Wear comfortable clothes that will allow your healthcare provider to expose the right side of your rib cage.

When and where is my appointment?

Date: _____
